

# Introduction to R Markdown

DIME Analytics

---

Presented by Luis Eduardo San Martin

The World Bank | [WB Github](#)

February 2022

# Introduction

- This is an **introduction** to R Markdown
- We'll show:
  1. How to write and knit (output) R Markdown documents
  2. How to format text and R code in R Markdown documents

# Table of contents

1. Dynamic documents
2. Knitting
3. Markdown
4. R code
5. R plots
6. Inline code
7. Annex

# Dynamic documents

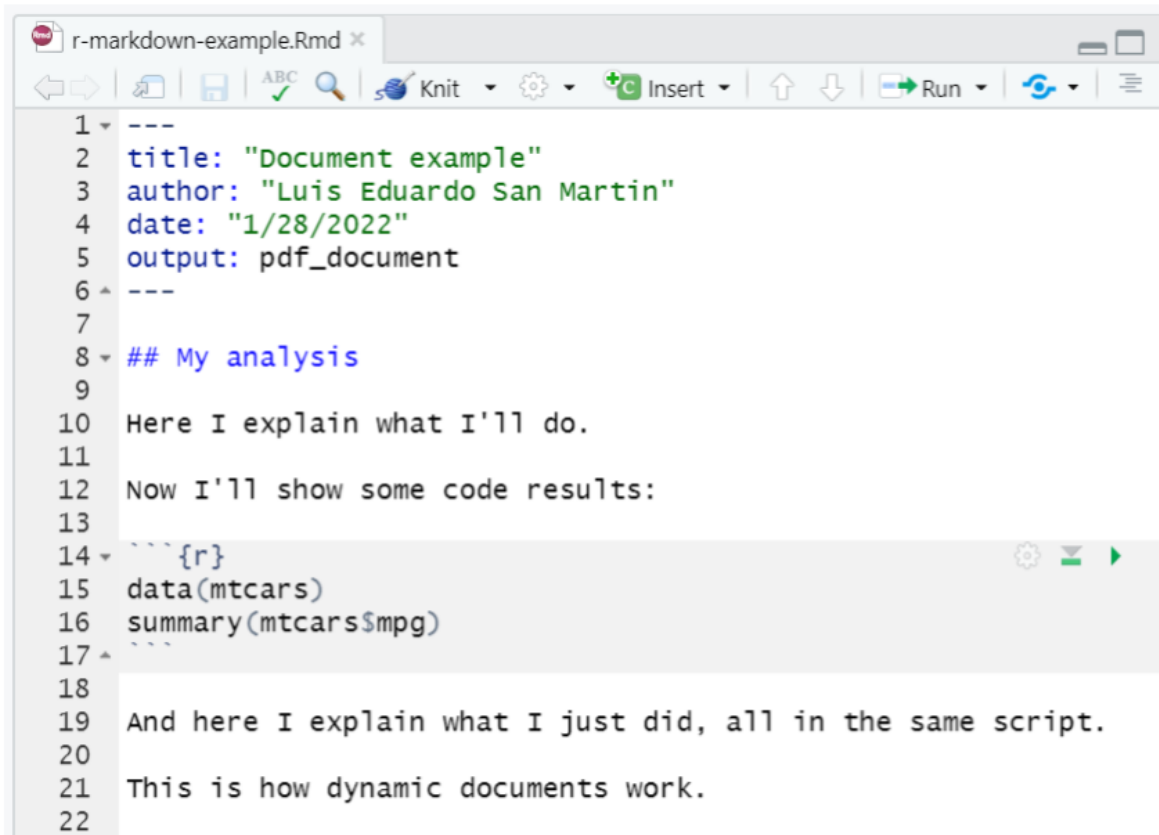

---

# Dynamic documents and R Markdown

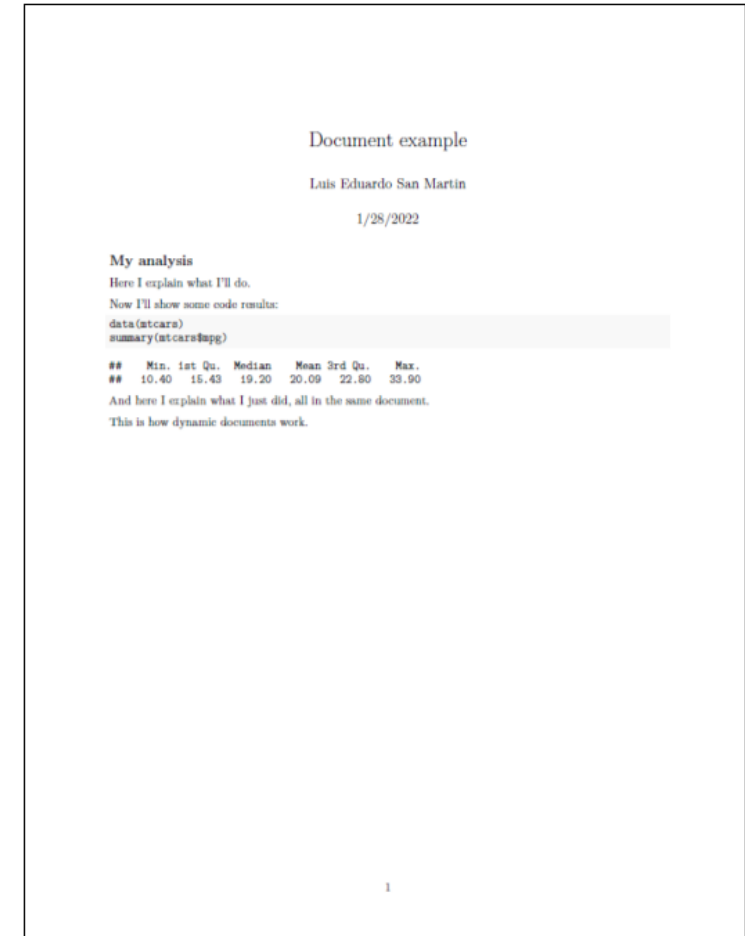

- Dynamic documents are documents that include both text and code outputs
- They are generated by a script and are updated automatically every time the script runs
- R Markdown is a type of dynamic document

# Dynamic documents

- Code and documentation is produced together

```
1 ---
2 title: "Document example"
3 author: "Luis Eduardo San Martin"
4 date: "1/28/2022"
5 output: pdf_document
6 ---
7
8 ## My analysis
9
10 Here I explain what I'll do.
11
12 Now I'll show some code results:
13
14 ```{r}
15 data(mtcars)
16 summary(mtcars$mpg)
17 ```
18
19 And here I explain what I just did, all in the same script.
20
21 This is how dynamic documents work.
22
```

Document example

Luis Eduardo San Martin

1/28/2022

**My analysis**

Here I explain what I'll do.

Now I'll show some code results:

```
data(mtcars)
summary(mtcars$mpg)
```

##	Min.	1st Qu.	Median	Mean	3rd Qu.	Max.
##	10.40	15.43	19.20	20.09	22.80	33.90

And here I explain what I just did, all in the same document.

This is how dynamic documents work.

1

# Why use dynamic documents?

- Increased research transparency. Documents are fully reproducible
- No more copying and pasting outputs from R to a document editor
- Nice option for simple documents that don't require a lot of formatting
- Can include code snippets

# Knitting R Markdown documents

---

# Knitting R Markdown documents

- R markdown combines text, R code, and rendered outputs
- The text follows Markdown's syntax
- The code and outputs follow R's syntax
- Knitting an R Markdown document is rendering the text and code portions into a single output
- The output can be a PDF, Word, or HTML document

# Knitting R Markdown documents

## Exercise 1

1. Go to [our R trainings repository](#)
2. In the files panel, download `Introduction to R Markdown...` > `r-markdown-template.Rmd`
3. Open this file in RStudio
4. Click on `Knit`. If RStudio asks you to update some packages, select `Yes`

# Knitting R Markdown documents

- Knitting a file to PDF means that RStudio created a PDF file from an R Markdown file
- You'll now see this PDF file in the folder where you saved `markdown-template.Rmd`

Name	Date modified	Type
 Code	1/28/2022 2:51 PM	File folder
 DataSets	8/24/2020 3:42 PM	File folder
 Output	4/5/2021 4:37 PM	File folder
 descriptive-statistics.R	1/13/2022 1:29 PM	R File
 r-markdown-template.pdf	2/1/2022 10:51 PM	Adobe Acrobat Docu...
 r-markdown-template.Rmd	2/1/2022 10:36 PM	RMD File

# Markdown

---

# Markdown

- The text part of R Markdown follows the syntax of Markdown
- Markdown is a "light" markup language. It's similar to Latex or HTML, but simpler
- Markdown was designed to be easily readable while allowing to format text and document sections

# Markdown - Headers

- Headers in markdown are preceded by pound (#) symbols
- Additional pound symbols denote a lower level in the headers hierarchy

```
# This is a header  
## Subheader 1  
### Subheader 2  
#### Subheader 3
```

This is a header  
Subheader 1  
Subheader 2  
Subheader 3

# Markdown - Paragraphs

- Text not preceded by special symbols conform regular paragraphs.

```
## Paragraphs
```

```
This is a line of text.  
This is another line in the same paragraph.
```

```
New paragraphs are separated by two line breaks.
```

## Paragraphs

This is a line of text. This is another line in the same paragraph.

New paragraphs are separated by two line breaks.

# Markdown - Text emphasis

- Emphasized text is enclosed by special symbols.

## ## Text emphasis

Text in italics goes between `*asterisks*` or `_underscores_`.

Text in bold goes between `**two asterisks**` or `__two underscores__`.

You can combine asterisks and underscores to `**emphasize with italics and bold _at the same time_**`.

Strikethrough text `~~uses two tildes~~`.

## Text emphasis

Text in italics goes between *asterisks* or *underscores*.

Text in bold goes between **two asterisks** or **two underscores**.

You can combine asterisks and underscores to ***emphasize with italics and bold at the same time***.

Strikethrough text ~~uses two tildes~~.

# Markdown - Lists

- Markdown allows us to use both ordered and unordered lists.

## ## Lists

Ordered lists:

1. Include a number and a dot before every item
2. Also remember to include a blank line before the beginning of the list
1. The actual number does not matter, the item will have the correct order number

Unordered lists:

- \* You can use an asterisk
- + Or a plus symbol
- Or a minus symbol

## Lists

Ordered lists:

1. Include a number and a dot before every item
2. Also remember to include a blank line before the beginning of the list
3. The actual number does not matter, the item will have the correct order number

Unordered lists:

- You can use an asterisk
- Or a plus symbol
- Or a minus symbol

# Markdown - Links

- Lastly, we can also include links as text in Markdown.

## ## Links

Include the link text in brackets followed by the URL in parentheses.  
Like this:

This is [`the WB website`](`https://https://www.worldbank.org`)

## Links

Include the link text in brackets followed by the URL in parentheses. Like this:

This is the WB website

<https://https://www.worldbank.org>

# R Code

---

# Including R code

- R code in R Markdown goes inside **fenced code blocks**, as the one below

```
```${r}  
# Your R code goes here  
```
```

# Including R code

- To add new block, you can type the fences directly, go to **Insert** > **R** in the script panel of RStudio, or type **CTRL** + **ALT** + **i**

# Including R code

## Exercise 2

Include the summary of a variable in the document.

1. Create a header named `R Code` at the bottom of `markdown-template.Rmd`
2. Create a new fenced code block where you load the sample dataset `mtcars`
  - `mtcars` is a built-in dataset
  - load it with: `data(mtcars)`
3. Inside the same block, get the summary of the variable `mpg` with `summary(mtcars$mpg)`
4. Knit and check how this is rendered in the resulting file. Note that you'll have to close the PDF document to knit it again

# Including R code

# R code

```
```\{r}  
data(mtcars)  
summary(mtcars$mpg)  
```
```

R code

```
data(mtcars)  
summary(mtcars$mpg)
```

```
##      Min. 1st Qu.  Median    Mean 3rd Qu.    Max.   
##  10.40   15.43   19.20   20.09   22.80   33.90
```

# Including R code

- Note that the output echoes both the code and the output
- What if we wanted to include the output but not the code?
- We use the argument `echo = FALSE` in the fenced code block for that
- Code block arguments are separated by commas inside the curly brackets, as in:

```
```{r, echo = FALSE}  
data(mtcars)  
summary(mtcars$mpg)  
```
```

# Including R code

## Exercise 3

Omit the code when knitting R code.

1. Add the option `echo = FALSE` to the fenced code block created in exercise 2
2. Knit the document and check the difference

# Including R code

# R code

```
`` `{r, echo = FALSE}  
data(mtcars)  
summary(mtcars$mpg)  
`` `
```

R code

|    |       |         |        |       |         |       |
|----|-------|---------|--------|-------|---------|-------|
| ## | Min.  | 1st Qu. | Median | Mean  | 3rd Qu. | Max.  |
| ## | 10.40 | 15.43   | 19.20  | 20.09 | 22.80   | 33.90 |

# Including R code

- To include R code but not the output, we can use the option `eval = FALSE`

```
```{r, eval = FALSE}  
data(mtcars)  
summary(mtcars$mpg)  
```
```

# Including R code

# R code

```
```${r, eval = FALSE}  
data(mtcars)  
summary(mtcars$mpg)  
```
```

**R code**

```
data(mtcars)  
summary(mtcars$mpg)
```

# R Plots

---

# Including R plots

- Adding R plots is similar to adding R code
- Include the code producing the plot in a fenced block
- The block option `echo = FALSE` is useful when we only want to include the plot but not the code producing it

# Including R plots

## Exercise 4

Include an R plot in your document.

1. Create a new header named `R Plots` at the bottom of `markdown-template.Rmd`
2. Create a new fenced code block with the option `echo` set to `FALSE`
3. Add the following code inside the new block:

```
plot(mtcars$wt,  
     mtcars$mpg,  
     main = "Plot example",  
     xlab = "Car weight",  
     ylab = "Miles per gallon")
```

# Including R plots

# R Plots

```
{r, echo = FALSE}  
plot(mtcars$wt,  
      mtcars$mpg,  
      main = "Plot example",  
      xlab = "Car weight",  
      ylab = "Miles per gallon")  
...
```

R Plots

Plot example

# Inline code

---

# Including code inline

- Inline code is enclosed by backtick followed by an r (``r``) and a single backtick (```)
- For example:

The mean of mpg is ``r mean(mtcars$mpg)``.

- Will be rendered as:

The mean of mpg is 20.090625.

# Including code inline

## Exercise 5

1. Create a new header named `Inline code` at the bottom of `markdown-template.Rmd`
2. Add an unordered list with the items:
  - The number of elements in `mtcars` is:
  - The mean of weight is:
  - The standard deviation is:
3. Use the functions `nrow()`, `mean()`, and `sd()` in the corresponding list items so that the correct values are rendered. Remember you can select the weight variable like this: `mtcars$wt`

# Including code inline

## # Inline code

- The number of elements in mtcars is: ``r nrow(mtcars)``
- The mean of weight is: ``r mean(mtcars$wt)``
- The standard deviation is: ``r sd(mtcars$wt)``

## Inline code

- The number of elements in mtcars is: 32
- The mean of weight is: 3.21725
- The standard deviation is: 0.9784574

Thank you!

# Annex

---

# Annex - Opening a new R Markdown in R Studio

- Go to **File** > **New File** > **R Markdown**
- You can register the author name and the document title. This can be changed later if needed
- You can also define the default output format (HTML, PDF, Word). This can also be changed later
- Selecting **OK** will generate a template with document sections and code blocks that you can modify
- Selecting **Create Empty Document** will ignore the author, title, and output format registered and will result in a completely blank R Markdown document

# Annex - Author, title, and output type

- The section enclosed in `---` at the beginning of the document can contain the author, title, and default output format
- You can add the author and document title with `author: NAME` and `title: TITLE`
- You can also change the default output format. Some options are:
  - `output: html_document`
  - `output: pdf_document`
  - `output: word_document`
  - `output: beamer_presentation`

# Annex - Including images

- The Markdown syntax to include images is: `![Image name](path/to/image)`
- For example:

```
![R logo](img/r-markdown/r-logo.jpg)
```

- Renders:
