#### Introduction to R Markdown

DIME Analytics

Presented by Luis Eduardo San Martin The World Bank | WB Github February 2022

#### Table of contents

- 1. Dynamic documents
- 2. Knitting
- 3. Markdown
- 4. R code
- 5. R plots
- 6. Inline code
- 7. Annex

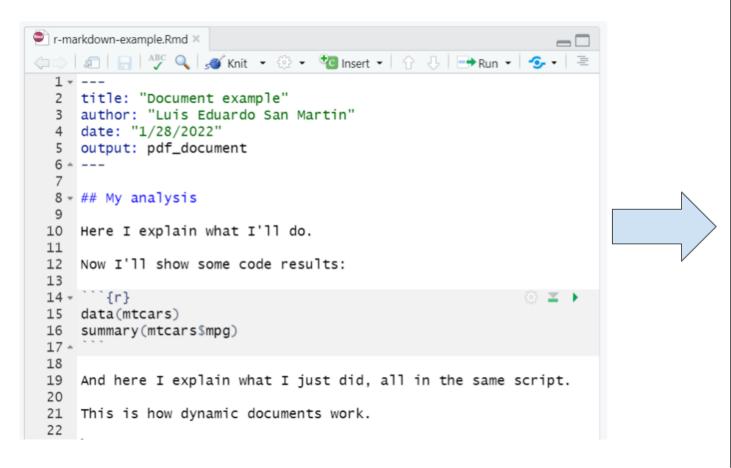

# Dynamic documents

## Dynamic documents

- Dynamic documents are documents that include both text and code outputs. They are generated by a script and are updated automatically every time the script runs
- In the context of this presentations, all code outputs will be R outputs

#### Dynamic documents

Code and documentation is produced together

# Why use dynamic documents?

- Increased research transparency. Documents are fully reproducible
- No more copying and pasting outputs from R to document editor
- Nice option for simple documents that don't require a lot of formatting
- Can include code snippets or code examples

- R markdown combines R code, rendered outputs and text.
- The code and outputs follow the syntax of R, while the text follows markdown's syntax
- Exports the documents to PDF, Word, HTML

#### Exercise 1

- 1. Go to our R trainings repository
- 2. In the files panel, download <a href="Introduction to R Markdown">Introduction to R Markdown</a>... > r-markdown-template.Rmd
- 3. Open this file in RStudio
- 4. Click on Knit > Knit to PDF

- Knitting a file to PDF means that RStudio created a PDF file from an R Markdown file
- You'll now see this PDF file in the folder where you saved markdowntemplate.Rmd

# Markdown

#### Markdown

- As we indicated previously, the text part of R Markdown follows the syntax of Markdown
- Markdown is a lightweight markup language. It's similar to Latex or HTML, but simpler
- Markdown was designed to be easily readable while allowing to define text format

#### Markdown - Headers

- Headers in markdown are preceded by pound (#) symbols
- Additional pound symbols denote a lower level in the headers hierarchy

```
# This is a header
## Subheader 1
### Subheader 2
#### Subheader 3
```

This is a header

Subheader 1

Subheader 2

Subheader 3

#### Markdown - Paragraphs

• Text not preceded by special symbols is a regular pragraph.

#### ## Paragraphs

This is a line of text.
This is another line in the same paragraph.

New paragraphs are separated by two line breaks.

#### Paragraphs

This is a line of text. This is another line in the same paragraph.

New paragraphs are separated by two line breaks.

#### Markdown - Text emphasis

Emphasized text is enclosed by special symbols.

```
## Text emphasis
Text in italics goes between *asterisks* or _underscores_.
Text in bold goes between **two asterisks** or __two underscores__.
You can combine asterisks and underscores to **emphasize with italics and
bold _at the same time_**.
Strikethrough text ~~uses two tildes~~.
```

#### Text emphasis

Text in italics goes between asterisks or underscores.

Text in bold goes between two asterisks or two underscores.

You can combine asterisks and underscores to emphasize with italics and bold at the same time.

Strikethrough text uses two tildes.

#### Markdown - Lists

Markdown allows to use ordered and unordered lists.

#### ## Lists

#### Ordered lists:

- 1. Include a number and a dot before every item
- 2. Also remember to include a blank line before the beginning of the list
- 1. The actual number does not matter, the item will have the correct order number

#### Unordered lists:

- \* You can use an asterisk
- + Or a plus symbol
- Or a minus symbol

#### Lists

#### Ordered lists:

- 1. Include a number and a dot before every item
- 2. Also remember to include a blank line before the beginning of the list
- 3. The actual number does not matter, the item will have the correct order number

#### Unordered lists:

- You can use an asterisk
- Or a plus symbol
- Or a minus symbol

#### Markdown - Links

• Lastly, we can also include links as text in Markdown.

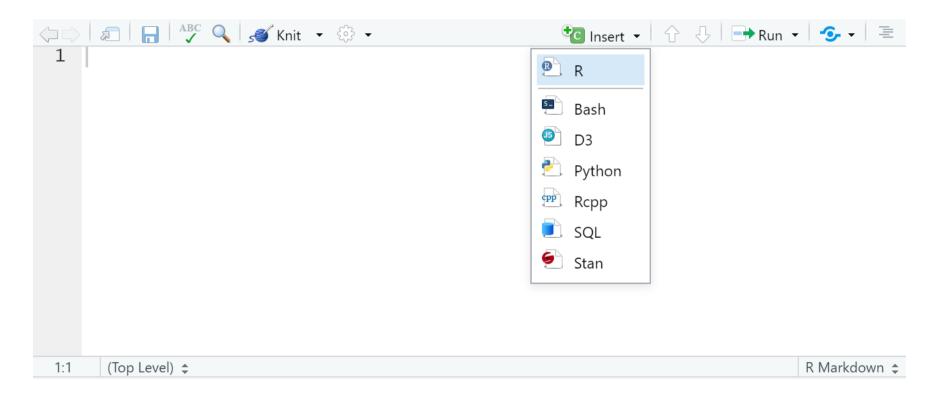

# ## Links Include the link text in brackets followed by the URL in parentheses. Like this: This is [the WB website](https://https://www.worldbank.org) Links Include the link text in brackets followed by the URL in parentheses. Like this: This is the WB website https://https://www.worldbank.org

# R Code

• R code in R Markdown goes inside **fenced code blocks**, as the one below

```
```{r}
# Your R code goes here
```
```

• You can type the fenced code blocks directly or go to <a href="Insert">Insert</a> > R in the script panel of RStudio to create a new block

#### Exercise 2

Include the summary of a variable in the document.

- 1. Create a header named R Code at the bottom of markdown-template.Rmd
- 2. Create a new fenced code block where you load the sample dataset mtcars
  - o mtcars is a built-in dataset
  - o load it with: data(mtcars)
- 3. Inside the same block, get the summary of the variable mpg with summary(mtcars\$mpg)
- 4. Knit the document to PDF and check how this is rendered in the resulting file

#### # R code

```
data(mtcars)
summary(mtcars$mpg)
```

19.20

20.09 22.80

#### R code

10.40 15.43

```
data(mtcars)
summary(mtcars$mpg)

## Min. 1st Qu. Median Mean 3rd Qu. Max.
```

33.90

- Note that the output echoes both the code and the output
- What if we wanted to include the output but not the code?
- We use argument echo = FALSE in the fenced code block for that
- Code block arguments are separated by commas inside the curly brackets, as in:

```
```{r, echo = FALSE}
data(mtcars)
summary(mtcars$mpg)
```
```

#### Exercise 3

Omit the code when knitting R code.

- 1. Add the option echo = FALSE to the fenced code block created in exercise 2
- 2. Knit the document into PDF and check the difference

```
# R code
```{r, echo = FALSE}
data(mtcars)
summary(mtcars$mpg)
 R code
 ##
      Min. 1st Qu. Median
                            Mean 3rd Qu.
  Max.
 ##
      10.40 15.43 19.20
                              20.09
                                     22.80
  33.90
```

• To include R code but not the output, we can use the option eval = FALSE

```
```{r, eval = FALSE}
data(mtcars)
summary(mtcars$mpg)
```
```

```
# R code

{r, eval = FALSE}
data(mtcars)
summary(mtcars$mpg)

R code

data(mtcars)
summary(mtcars$mpg)
```

# R Plots

# Including R plots

- Adding R plots is similar to adding R code
- Include the code producing the plot in a fenced block
- The block option echo = FALSE is useful when we only want to include the plot but not the code producing it

## Including R plots

#### Exercise 4

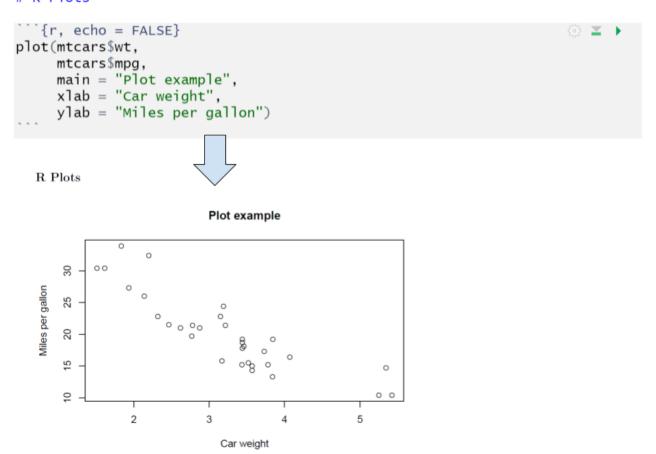

Include an R plot in your document.

- 1. Create a new header named R Plots at the bottom of markdown-template.Rmd
- 2. Create a new fenced code block with the option echo set to FALSE
- 3. Add the following code inside the new block:

```
plot(mtcars$wt,
    mtcars$mpg,
    main = "Plot example",
    xlab = "Car weight",
    ylab = "Miles per gallon")
```

# Including R plots

#### # R Plots

# Inline code

# Including code inline

- Inline code is enclosed by backtick followed by an r (`r) and a single backtick (`)
- For example:

The mean of mpg is `r mean(mtcars\$mpg)`.

• Will be rendered as:

The mean of mpg is 20.090625.

# Including code inline

#### Exercise 5

- 1. Create a new header named <a href="Inline code">Inline code</a> at the bottom of <a href="markdown-template.Rmd">markdown-template.Rmd</a>
- 2. Add an unordered list with the items:
  - The number of elements in mtcars is:
  - The mean of weight is:
  - The standard deviation is:
- 3. Use the functions <code>nrow()</code>, <code>mean()</code>, and <code>sd()</code> in the corresponding list items so that the correct values are rendered. Remember you can select the weight variable like this: <code>mtcars\$wt</code>

## Including code inline

```
# Inline code

- The number of elements in mtcars is: `r nrow(mtcars)`
- The mean of weight is: `r mean(mtcars$wt)`
- The standard deviation is: `r sd(mtcars$wt)`
```

#### Inline code

- The number of elements in mtcars is: 32
- The mean of weight is: 3.21725
- The standard deviation is: 0.9784574

#### Annex

## Annex - Opening a new R Markdown in R Studio

- Go to File > New File > R Markdown
- You can register the author name and the document title. This can be changed later if needed
- You can also define the default output format (HTML, PDF, Word). This can also be changed later
- Selecting **OK** will generate a template with document sections and code blocks that you can modify
- Selecting Create Empty Document will ignore the author, title, and output format registered and will result in a completely blank R Markdown document

#### Annex - Author, title, and output type

- The section enclosed in --- at the beginning of the document can contain the author, title, and default output format
- You can add the author and document title with <a href="mailto:author: NAME">author: NAME</a> and <a href="mailto:title: name">title:</a>
- You can also change the default output format. Some options are:

```
    output: html_document
    output: pdf_document
    output: word_document
    output: beamer_presentation
```

# Annex - Including images

• The Markdown syntax to include images is:

```
![Image name](path/to/image)
```

• For example:

```
![R logo](img/r-markdown/r-logo.jpg)
```

• Renders:
